

DSE 2256 DESIGN & ANALYSIS OF ALGORITHMS

Lecture 4 & 5 :

Worst, Best & Average Case Efficiencies & Asymptotic Notations

Instructors:

Dr. Savitha G,
Assistant Professor, DSCA, MIT, Manipal

Dr. Abhilash K. Pai,
Assistant Professor, DSCA, MIT, Manipal

(a) Big-O Notation

(b) Big-Omega Notation

(c) Big-Theta Notation

Recap of L2 & L3

- Fundamental Data Structures
- Algorithm Analysis Framework
 - Measuring an Input's Size
 - Units for measuring Running Time
 - Orders of growth

$$T(n) \approx c_{op} C(n)$$

n	$\log_2 n$	n	$n \log_2 n$	n^2	n^3	2^n	$n!$
10	3.3	10^1	$3.3 \cdot 10^1$	10^2	10^3	10^3	$3.6 \cdot 10^6$
10^2	6.6	10^2	$6.6 \cdot 10^2$	10^4	10^6	$1.3 \cdot 10^{30}$	$9.3 \cdot 10^{157}$
10^3	10	10^3	$1.0 \cdot 10^4$	10^6	10^9		
10^4	13	10^4	$1.3 \cdot 10^5$	10^8	10^{12}		
10^5	17	10^5	$1.7 \cdot 10^6$	10^{10}	10^{15}		
10^6	20	10^6	$2.0 \cdot 10^7$	10^{12}	10^{18}		

Best-case, average-case, worst-case efficiencies I

For some algorithms, efficiency depends on form of input.

Example:

ALGORITHM *SequentialSearch*($A[0..n - 1]$, K)

//Searches for a given value in a given array by sequential search

//Input: An array $A[0..n - 1]$ and a search key K

//Output: The index of the first element in A that matches K

// or -1 if there are no matching elements

$i \leftarrow 0$

while $i < n$ **and** $A[i] \neq K$ **do**

$i \leftarrow i + 1$

if $i < n$ **return** i

else return -1

For this example:

- How would the **worst** possible form of input look like ?
 - What about $C(n)$ in this case?

- How would the **best** possible form of input look like ?
 - What about $C(n)$ in this case?

Best-case, average-case, worst-case efficiencies II

- Worst case: $C_{\text{worst}}(n)$ – maximum over inputs of size n
- Best case: $C_{\text{best}}(n)$ – minimum over inputs of size n
- Average case: $C_{\text{avg}}(n)$ – “average” over inputs of size n

How to analyze an algorithm's average case efficiency?

Best-case, average-case, worst-case efficiencies II

For the sequential search example, assume the following:

- The probability of a successful search is equal to p (where, $0 \leq p \leq 1$)
- The probability of the first match occurring in the i^{th} position of the list is same, i.e., $\frac{p}{n}$, for every i .

$$\begin{aligned} C_{\text{avg}}(n) &= \left[1 \cdot \frac{p}{n} + 2 \cdot \frac{p}{n} + 3 \cdot \frac{p}{n} + \dots + i \cdot \frac{p}{n} + \dots + n \cdot \frac{p}{n} \right] + n(1-p) \\ &= \frac{p}{n} [1 + 2 + 3 + \dots + n] + n(1-p) \\ &= \frac{p}{n} \cdot \frac{n(n+1)}{2} + n(1-p) \\ C_{\text{avg}}(n) &= \frac{p(n+1)}{2} + n(1-p) \end{aligned}$$

When the key is present in the array

When the key is not present

"i" comparison operations are done when the element is found at i^{th} location

Best-case, average-case, worst-case efficiencies IV

Remember that average case efficiency is:

- Not the average of worst and best case.
- Expected number of basic operations considered as a random variable under some assumption about the probability distribution of all possible inputs.

So, average = expectation under uniform distribution.

Asymptotic Notations I

The order of growth of $C(n)$ is the principal indicator of an algorithm's efficiency.

Three notations to compare and rank the order of growths:

1. $O(g(n))$ is the set of all functions with a smaller or same order of growth as $g(n)$.

Ex: $n \in O(n^2)$

2. $\Omega(g(n))$ stands for the set of all functions with larger or same order of growth as $g(n)$.

Ex: $n^3 \in \Omega(n^2)$

3. $\Theta(g(n))$ is the set of all functions that have same order of growth as $g(n)$.

Ex: $7n^2 \in \Theta(n^2)$

Asymptotic Notations II

- $\mathcal{O}(g(n))$: class of functions $t(n)$ that grow **no faster** than $g(n)$
- $\Theta(g(n))$: class of functions $t(n)$ that grow **at same rate** as $g(n)$
- $\Omega(g(n))$: class of functions $t(n)$ that grow **at least as fast** as $g(n)$

Big-oh (O) notation

Definition:

A function $t(n)$ is said to be in $O(g(n))$, denoted as $t(n) \in O(g(n))$:
if $t(n)$ is bounded above by some constant multiple of $g(n)$ for all large n ,
i.e., there exist positive constant c and non-negative integer n_0 such that:

$$t(n) \leq c g(n) \text{ for every } n \geq n_0$$

Examples:

- $10n \in O(n^2)$
- $5n+20 \in O(n)$

Big-omega (Ω) notation

Definition:

A function $t(n)$ is said to be in $\Omega(g(n))$, denoted as $t(n) \in \Omega(g(n))$:
if $t(n)$ is bounded below by some positive constant multiple of $g(n)$ for all large n ,
i.e., there exist positive constant c and non-negative integer n_0 such that:

$$t(n) \geq c g(n) \text{ for every } n \geq n_0$$

Examples:

- $10n^2 \in \Omega(n^2)$
- $0.3n^2 - 2n \in \Omega(n^2)$
- $0.1n^3 \in \Omega(n^2)$

Big-theta(Θ) notation

Definition:

A function $t(n)$ is said to be in $\Theta(g(n))$, denoted as $t(n) \in \Theta(g(n))$:

if $t(n)$ is bounded both above and below by some positive constant multiple of $g(n)$ for all large n ,

i.e., there exist positive constant c and non-negative integer n_0 such that:

$$c_2 g(n) \leq t(n) \leq c_1 g(n) \text{ for every } n \geq n_0$$

Examples:

- $10n^2 \in \Theta(n^2)$
- $0.3n^2 - 2n \in \Theta(n^2)$
- $\frac{1}{2}n(n+1) \in \Theta(n^2)$

Exercises

1. Use the definition of \mathcal{O} , Ω and Θ to determine whether the following assertions are true or false.

$$a) \frac{n(n+1)}{2} \in \mathcal{O}(n^3)$$

$$b) \frac{n(n+1)}{2} \in \mathcal{O}(n^2)$$

$$c) \frac{n(n+1)}{2} \in \Theta(n^3)$$

$$d) \frac{n(n+1)}{2} \in \Omega(n)$$

Asymptotic Notations: Property

Theorem:

If $t_1(n) \in O(g_1(n))$ and $t_2(n) \in O(g_2(n))$, then

$$t_1(n) + t_2(n) \in O(\max\{g_1(n), g_2(n)\}).$$

Proof:

- For real numbers, If $a_1 \leq b_1$ and $a_2 \leq b_2$ then,

$$a_1 + a_2 \leq 2 \max\{b_1, b_2\}$$

- Since $t_1(n) \in O(g_1(n))$, there exist constants c_1, c_2, n_1, n_2 such that :

$$t_1(n) \leq c_1 * g_1(n), \text{ for all } n \geq n_1$$

- Similarly, since $t_2(n) \in O(g_2(n))$: $t_2(n) \leq c_2 * g_2(n)$, for all $n \geq n_2$

Contd ..

Asymptotic Notations: Property

- Adding the two inequalities above yields the following:

$$t_1(n) + t_2(n) \leq c_1 g_1(n) + c_2 g_2(n)$$

$$\leq c_3 g_1(n) + c_3 g_2(n) = c_3 [g_1(n) + g_2(n)]$$

$$\leq c_3 2 \max\{g_1(n), g_2(n)\}$$

- Hence, $t_1(n) + t_2(n) \in O(\max\{g_1(n), g_2(n)\})$, with the constants c_2, c_3 and n_0 required by the O definition being $c_3 = \max\{c_1, c_2\}$ and $n \geq \max\{n_1, n_2\}$, respectively.

Using limits for comparing orders of growth

$$\lim_{n \rightarrow \infty} t(n) / g(n) =$$

0 order of growth of $T(n)$ < order of growth of $g(n)$

$c > 0$ order of growth of $T(n)$ = order of growth of $g(n)$

∞ order of growth of $T(n)$ > order of growth of $g(n)$

Basic asymptotic efficiency classes

Class	Name
1	constant
$\log n$	logarithmic
n	linear
$n \log n$	n-log-n
n^2	quadratic
n^3	cubic
2^n	exponential
$n!$	factorial

Thank you!
